Attempt : 1
Total Mark : 40
Marks Obtained : 40

Section 1 : Coding

1. Problem Statement

Alex is practicing programming and is curious about prime and non-prime digits. He wants to write a program that calculates the sum of the non-prime digits in a given integer using loops.

Help Alex to complete his task.

Example:

Input:

845

output:

12

Explanation:

Digits: 8 (non-prime), 4 (non-prime), 5 (prime)

The sum of Non-Prime Digits: 8 + 4 = 12

Output: 12

Input Format

The input consists of a single integer X.

Output Format

The output prints an integer representing the sum of non-prime digits in X.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 845

Output: 12

Answer

```
# You are using Python
x=input()
sum=0
for digit in x:
    if digit.isdigit():
        num=int(digit)
        if num in[0,1,4,6,8,9]:
            sum+=num

print(sum)
```

Status : Correct ***Marks : 10/10***

2. Problem Statement

Max is fascinated by prime numbers and the Fibonacci sequence. He

wants to combine these two interests by creating a program that outputs the first n prime numbers within the Fibonacci sequence.

Your task is to help Max by writing a program that prints the first n prime numbers in the Fibonacci sequence using a while loop along with the break statement to achieve the desired functionality.

Input Format

The input consists of an integer n, representing the number of prime Fibonacci numbers to generate.

Output Format

The output displays space-separated first n prime numbers found in the Fibonacci sequence.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5

Output: 2 3 5 13 89

Answer

```
import math
def isprime(num):
    if num<=1:
        return False
    for i in range(2,int(math.sqrt(num))+1):
        if num%i==0:
            return False
    return True

def primefibonacci(n):
    primes=[]
    a,b=0,1
    while len(primes)<n:
        a,b=b,a+b
        if isprime(a):
            primes.append(a)
```

```
    return primes
n=int(input())
primefibnumbers=primefibonacci(n)
print(" ".join(map(str,primefibnumbers)))
```

Status : Correct **Marks : 10/10**

3. Problem Statement

Gabriel is working on a wildlife research project where he needs to compute various metrics for different animals based on their characteristics. Each animal type requires a different calculation: a deer's distance traveled, a bear's weight based on footprint size, or a bird's altitude based on its flying pattern.

Conditions:

For Deer (Mode 'D' or 'd'): Distance = speed of sound * time taken, where the speed of sound in air is 343 meters per second.For Bear (Mode 'B' or 'b'): Weight = footprint size * average weight, where the average weight per square inch for a bear is 5.0 pounds.For Bird (Mode 'F' or 'f'): Altitude = flying pattern * distance covered (in meters).

Write a program to help Gabriel analyze the characteristics of animals based on the given inputs.

Input Format

The first line of input consists of a character, representing the type of animal 'D/d' for deer, 'B/b' for bear, and 'F/f' for bird.

If the choice is 'D' or 'd':

The second line of input consists of a floating-point value T, representing the time taken from the deer's location to the observer.

If the choice is 'B' or 'b':

The second line of input consists of a floating-point value S, representing the size of the bear's footprint in square inches.

If the choice is 'F' or 'f':

1. The second line of input consists of a floating-point value P, representing the bird's flying pattern.
2. The third line consists of a floating-point value D, representing the distance covered by the bird in meters.

Output Format

The output prints one of the following:

If the choice is 'D' or 'd':

The output prints "Distance: X m" where X is a floating point value rounded off to two decimal places, representing the calculated distance traveled by the sound wave in meters.

If the choice is 'B' or 'b':

The output prints "Weight: Y lb" where Y is a floating point value rounded off to two decimal places, representing the estimated weight of the bear in pounds.

If the choice is 'F' or 'f':

The output prints "Altitude: Z m" where Z is a floating point value rounded off to two decimal places, representing the calculated altitude of the bird's flight in meters.

If the given choice is invalid, print "Invalid".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: d
2.5
Output: Distance: 857.50 m

Answer

```
# You are using Python
animal_type=input()
```

```
if animal_type=='D'or animal_type=='d':
    T=float(input())
    distance=343*T
    print(f"Distance: {distance:.2f}m")

elif animal_type=='B'or animal_type=='b':
    S=float(input())
    weight=S*5.0
    print(f"Weight: {weight:.2f}lb")

elif animal_type=='F'or animal_type=='f':
    P=float(input())
    D=float(input())
    altitude=P*D
    print(f"Altitude: {altitude:.2f}m")

else:
    print("Invalid")
```

Status : Correct ***Marks : 10/10***

4. Problem Statement

Nisha is a mathematics enthusiast, eager to explore the realm of twin prime numbers. The objective is to develop a program that enables the discovery and presentation of twin prime pairs.

The program should take an integer 'n' as input and generate 'n' pairs of twin primes, displaying the pairs with a difference of 2 between them.

Input Format

The input consists of a single integer, n.

Output Format

The output displays the 'n' pairs of twin primes, the pairs with a difference of 2 between them.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5

Output: 3 5
5 7
11 13
17 19
29 31

Answer

```
# You are using Python
n=int(input())
count=0
num=2
while count<n:
    if num>1:
        isprime1=True
    for i in range(2,int(num**0.5)+1):
        if num%i==0:
            isprime1=False
            break

    isprime2=True
    if num+2>1:
        for i in range(2,int((num+2)**0.5)+1):
            if (num+2)%i==0:
                isprime2=False
                break

        if isprime1 and isprime2:
            print(num,num+2)
            count+=1

        num+=1
```

Status : Correct ***Marks : 10/10***
